Tank heater for viscous petroleum products. Neft.khoz. 36 no.8:
61-64 Ag '58. (MIRA 11:12)
(Steam heating) (Petroleum products) (Tanks)

AUTHOR: Rusetskii, I. P. SOV/93-58-8-12/15

TITLE: Preheater for Viscous Petroleum Products in Tanks
(Podogrevatel' vyazkikh nefteproduktov v rezervuarakh)

PERIODICAL: Neftyanoye khozyaystvo, 1958, Nr 8, pp. 61-64 (USSR)

ABSTRACT: The author states that the available techniques for preheating lubricating oils to facilitate the unloading of tanks do not satisfy industrial requirements. This is especially true in Siberia where some lubricants require preheating all year round. The average bulk plant handles 20 grades of lubricating oil which are preheated in horizontal tanks equipped with fixed coils of pipe in accordance with GOST 4618-49 specifications, and in vertical tanks with coils of pipe at the bottom of the tank. Raising the temperature of the 20 grades of lubricating oil from -10° to + 30° in 20 horizontal tanks of 50 cu. m. capacity each requires about 47 tons of steam. Most bulk plants

Card 1/3

Preheater for Viscous Petroleum (Cont.)

SOV/93-58-8-12/15

do not have boilers of such high capacity and since one boiler of 25-28 sq. m. heating surface can simultaneously preheat only three horizontal tanks, lubricants can be released on certain days only. Furthermore, a bulk plant handling 20 grades of lubricating oil simultaneously preheats 900 tons and releases only 70 tons per day, requiring only 3.7 tons of steam for preheating. Consequently, a bulk plant spends 44 tons of steam on preheating unreleased lubricating oil and is required to maintain a boiler room of 13 times higher capacity than it actually needs. In recent years some bulk plants have acquired horizontal tanks of 75 cu. m. and vertical tanks of 100-200 cu. m. capacity so that the present practice of preheating will increase the consumption of steam for unproductive purposes in proportion to the enlarged tank capacity. These shortcomings in preheating

Card 2/3

Preheater for Viscous Petroleum (Cont.)

SOV/93-58-8-12/15

practice were pointed out at the 1957 Omsk conference of young specialists from Glavneftesbyt who suggested the adaption of a new preheater (Fig. 1). The layout of the new preheater in vertical tanks is shown in Fig. 2, and in horizontal tanks in Fig. 3. The heating of 70 tons of lubricating oils by means of the new preheater will require 2,370 kg. of steam instead of the 47 tons of steam consumed for the simultaneous preheating of 900 tons of lubricating oils. Consequently, the boilers of 25-35 sq. m. heating surface available at the bulk plants will assure the preheating of lubricating oils in all the tanks. The new preheater is simple, convenient, efficient, and economical to operate. The construction cost of the new preheater is low and does not require any scarce materials. Such a preheater operating at only one Siberian bulk plant will save the plant 1,656 rubles a day. The author concludes that the new preheater must be installed at all the bulk plants. There are 3 figures.

AUTHOR: Rusev, Bogdan

TITLE: Rigorous adjustment of an open theodolite traverse, oriented at its both ends, by the method of indirect measurements

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 6, 1962, 35, abstract 6G219 ("Godishnik Inzh.-stroit. in-t. Fak. stroit., arkhitekt. i khidrotekhn.", 1961, v. 13, no. 1, 17 - 33, Bulgarian; German summary)

TEXT: In the author's opinion, adjustment by the method of indirect measurements is interesting from the theoretical viewpoint. Equations of errors are presented which were obtained by expanding into a Taylor series, with retaining linear terms of the right-hand sides, of the formulae: ✓

$$s = \sqrt{\Delta x^2 + \Delta y^2}, \quad \beta = \Delta \left(\arctg \frac{\Delta y}{\Delta x} \right).$$

(In the second formula angle β is determined from the difference of two directional angles).

TITLE: Vacuum casting of one-piece rotors

SOURCE: Liteynoye proizvodstvo, no. 2, 1964, 3-5

TOPIC TAGS: casting, rotor, rotor casting, one-piece rotors, mold, mold insert parts, Mb insert material, KPTs-1B pattern material, pressing, insert

ABSTRACT: Experiments were performed on vacuum casting of one-piece rotors. It was desired to obtain casts of high quality with a dense, fine-grained structure and an even distribution of the hardening phases in metal. The main problem involved the design of collapsible dies, and the proper choice of procedure for pouring and removing the carbamide inserts in the molds. The inserts, made of MB material and poured at 135-140C, had proper dimensions, but a large number of them showed gas-bubble flaws on the surface and could not be used. Heating carbamide above 140C produced inserts with clean surfaces but of incorrect size due to excessive shrinkage. The materials and the procedures chosen for pouring and for removing of such inserts and for the production of suitable molds are described in

Card 1/2

ACCESSION NR: AP4018293

the text. The rotor patterns were made of KPTs-1B material containing 80% rosin, 5% paraffin, and 15% ceresin. The metal (a heat-resistant alloy) was melted and cast in vacuum after being held for 30-35 minutes in the molten state. Its pouring temperature was 1500C and that of the molds was 950C. The pouring velocity was 1.67-1.8 kg/sec. This technique prevented the appearance of the oxide films, improved the properties of the casts, and resulted in a 100% acceptable production of rotors. PERIODICAL: Radiobiologiya, v. 1, no. 4, 1961, 555-558

TEXT: A study was made of the significance of the catalase reaction and the significance of water-soluble peroxides in the pathogenesis of acute radiation sickness. The study was made possible by the fact that Radev (Ref. 4: Izv. in-ta. sravn. patol. zhivotnykh, 4, 135, 1958) discovered guinea pigs whose blood catalase activity was approximately 30 times lower than normal. The tissues of these animals were also poor in catalase. The aim of the experiment was to determine whether hypocatalase guinea pigs were more sensitive to radioactivity than are normal guinea pigs. The animals were exposed to X-ray irradiation in a dose of 500 r at an intensity of 68.3 r/min. Clinical and biochemical examination showed that the course of radiation sickness in the hypocatalase guinea pigs was no graver than in normal animals. This showed that the

extent of catalase activity has no effect on the course of acute radiation sickness. These findings contradict those of P. Bonnet-Marry and M. Frilley (Ref. 7: C. r. Acad. sci., 2400, 1944) who found that intra-abdominal injection of catalase preparations lengthened the life of irradiated animals. At the same time, the first stage of acute radiation sickness was milder in the hypocatalase animals than in the normal ones. This may be due to the formation of lesser quantities of liposoluble peroxides in the hypocatalase guinea pigs immediately after irradiation. The hypocatalase guinea pigs differed constitutionally from normal animals in that their tissues have greater dehydrase activity and stronger glycolytic powers. The authors attribute the milder course of acute radiation sickness to these features of tissue respiration. These features, however, did not prevent the death of the hypocatalase animals on the 9th day after irradiation. In addition to one of the primary reactions, connected with the accumulation of lipo-soluble peroxides, some other reaction must develop after irradiation in both groups of animals, leading to their almost simultaneous death. The authors have no data on this reaction. There are 2 figures, 1 table

RUSEV, Khristo, Dr [Affiliation not given]

"The Hog Cholera Problem in Our Country."

Sofia, Veterinarna Sbirka, Vol 60, No 4, 1963; pp 4-8.

Abstract: General discussion and review of published literature from many countries, without full bibliographic references. Bulgarian pig population at end of 1961 was just over 2.5 million, and hog cholera is no longer a crucial problem except in imported animals, principally those from Rumania. Many recent studies on antigenicity, variability in virulence, host specificity and related aspects are discussed.
